Title : The Effect of Side Dressing on Potato Productivity. (Vliyaniye
podkormki na urozhaynost' kartofelya).

Orig Pub: So. nauchno-issled. rabot stud. Stavropol'sk. s.-kh. in-t,
1956, vyp. 4, 47-48.

Abstract: At the test site of the Stavropol' Agricultural Institute
the boost in the potato harvest through the application
of NPK in side dressing during various periods did not
exceed 10%; the yield was somewhat increased by the
supplemental feeding of N during budding.

TITLE: Graphic construction of the trajectory of electrons in a magnetron gun

SOURCE: Ref. zh. Fizika, Abs. 10Zh444

REF. SOURCE: Tr. Vses. n.-i. in-ta elektroterm. oborud., vyp. 1, 1965, 50-65

TOPIC TAGS: magnetron, electron motion, electron optics, electron gun

ABSTRACT: The possibility is considered of using a magnetic field to focus the electrons in powerful (up to 100 kW) magnetron guns for electronic heating. In this case the anode voltage can be reduced to 10 -- 15 kV; the requirements on the accuracy of the installation of the anode and the cathode are also less stringent. For a consistent design of the optical system, a graphic method has been developed for constructing the electron trajectories (ET) in superimposed homogeneous and inhomogeneous electric and magnetic fields with axial symmetry. The ET are constructed in the meridional plane by the radius-of-curvature method, $R = f(r, z)$, and the plane itself is rotated together with the electron at an angular velocity $\dot{\theta} = f(t)$. An advantage

b7

B

Cord 1/2

L 45522-66

ACC NR AR6013706

of the method is the possibility of calculating the ET not only in the regions near the axis, but also at arbitrary distances away from the axis. The calculated ET is in good agreement with the electron beam observed in a model. A shortcoming of the method is that the calculations are complicated and unyieldy. H. Mayer. PURPOSE: This collection of articles is intended for scientists and technicians
working in computing-machine building and related fields.

COVERAGE: This collection of articles presents the results of investigations
related to the design and development of electronic computers. It examines
the realization of some general and special algorithms by means of digital
and analog computers, investigates errors in the realization of functional
relationships in electronic analogs, and reviews problems of computing and
designing the external outfitts and arrangement of digital computers based
on various principles of operation. Methods of computation and the basic
characteristics of stabilized supply sources for digital and analog computers,

TITLE: Model Tests for the Determination of the Resistance and the Bridle Coefficients for Pushed Barge Trains (Model'nyye ispytaniya dlya opredeleniya soprotivleniya i koeffitsiyentov schala tolkayemykh vozav)

PERIODICAL: V kn.: Nauchn.-tekhn. konferentsiya po voprs. sudovozhdeniya metodom tolkaniya. Vodtransizdat, 1954, pp 133-149

ABSTRACT: The model-basin determination of the bridle coefficients requires the determination of the hydraulic resistance for the model train held together by the bridle and for each model separately. Test data are adduced for models larger than 1 meter representing a scale of 1:30 to 1:50; the resistance measurements were performed with an accuracy of up to 10 mg, at speeds maintained to within 0.001 m/sec. The tests were performed for three series of barges with from five to eight units of each series and two pusher tugs. The paper contains curves of the relative resistances of various bridling patterns comprising identical numbers of barges as functions of the traveling

2946. (794) A NEW METHOD OF 'CHINGA' TREATMENT (Russian text) -
Ait'ereva M. Ya. and Popov G. V. - VESTN. KHIR. 1958, 80, 6 (51-54)

'Chinga' is an occupational disease of finger joints in workers in the seal trade of Barentzov and the White Sea. A Gram-positive diplococcus resistant to physical and chemical agents is the causal organism, its source being the seal. The symptomatology of the disease and the results of treatment of 46 patients by a diplococcus serum are described. A follow-up of 2-3 yr. demonstrated the patients treated to have no visible finger joint changes and no impairment of their function.

TITLE: *On the Stability of High-Voltage Germanium Rectifiers of the DG-Ts Type (O stabil'nosti vysokovol'tnykh germaniyevskikh vypryamiteley tipa DG-Ts)*

PERIODICAL: *Dopovidi Akademii nauk Ukrains'koї RSR, 1958, Kr 7, pp 721-723 (USSR)*

ABSTRACT: *The authors present the results of an investigation of the artificial aging process of point high-voltage germanium rectifiers of the DG-Ts type under effect of electric load and cyclic changes in temperature from 20 - 50 - 20°C. The aging process is not eliminated in the investigated rectifiers, although they are more stable than the cuprous oxide rectifiers. On the basis of the observed regularities in the changes of the volt-ampere characteristics during aging process, a method is proposed for compensating the errors of measuring circuits which arise because of instability of the rectifier parameters in time. This method consists in self-compensation, i.e., parameters of the circuit are so chosen that the changes in*

TITLE:The Relations of Static and Dynamic Characteristics of High-Voltage
Semiconductor Rectifiers**PERIODICAL:**

Izmeritel'naya tekhnika, 1959, Nr. 6, pp 32-35 (USSR)

ABSTRACT:

In this paper the authors determine the static, $i=f(U)$, and the dynamic, $I_{cp}=f(U_{cp})$, half-wave characteristics of high-voltage semi-conductor rectifiers. They also consider the more characteristic case requiring the application of the dependency $I_{cp}=f(U_{cp})$ for the forward and reverse direction of the current passing thru the rectifier, the calculation and the analysis of temperature conditions of self-compensation of a symmetric germanium rectifier bridge circuit. The experimental investigation of static and dynamic characteristics of DG-Ts germanium rectifiers confirmed the correctness of the dependencies obtained. There are 2 graphs, 1 set of circuit diagrams and 6 references, 5 of which are Soviet and 1 American.

TITLE: New Method of Cleaning Air Bottles (Novyy sposob ochistki vozduzhnogo baliona)

PERIODICAL: Grazhdanskaya aviatsiya, 1958, Nr 5, p 27 (USSR)

ABSTRACT: The short article describes a new method of internal cleaning of air bottles of the Yak-12 plane, proposed by innovators I. Shchipitsyn and V. Kolomytskiy. The method consists in preparatory washing with a so-called SD solution, rinsing with a hot aqueous solution of sodium carbonate, liquid glass, and potassium bichromate, followed by drying. Mechanical cleaning is carried out with bits of a 3 - 4-mm hexagonal rod placed inside the bottle which is mounted on the oscillating frame of a jig-saw. The position of the bottle can be changed to ensure an even treatment of the whole surface. A diagrammatic drawing accompanies the text.

TITLE: Parametric Amplifiers Based on Semiconductor
Diodes

PERIODICAL: Radio, 1961, No. 3, pp. 21 - 24

TEXT: The normal amplifiers based on electron tubes or semiconductor devices are not particularly suitable for the detection of very weak signals due to the comparatively great internal noise. In recent years, this disadvantage has been partially overcome by the use of so-called parametric amplifiers. These are in the form of oscillatory systems in which one or some reactive elements (L or C) change periodically with time. In general, it is comparatively simple to change periodically or modulate the capacitance C of such a system. The energy from the source, known as the pumping source, which modulates the capacitance is converted into the signal energy by the reactive element. Such an amplifier, consisting

Card 1/4

89646

S/107/61/000/003/001/002
E192/E382

Parametric Amplifiers Based on Semiconductor Diodes
of an oscillatory circuit with a variable parameter and a pumping source, behaves, in fact, as if the pumping source introduces a negative resistance $-r$ into the signal circuit. This resistance reduces the ohmic losses in the circuit and increases its quality factor Q . However, apart from supplying a sufficient oscillation amplitude for modulating the capacitance, it is also necessary to secure the coincidence of the phases of the pumping and signal sources; further, the pumping frequency should be twice the signal frequency. A semiconductor diode whose capacitance is dependent on voltage can be used as the modulating reactance for a parametric amplifier. The magnitude of the negative resistance introduced into the circuit by such a diode is determined by $-r = +m/2wC$, where C is the average value of the capacitance, w is the signal frequency and m is the modulation coefficient which is defined by

Card 2/4

89646

S/107/61/000/003/001/002
E192/E382

Parametric Amplifiers

$$m = \frac{\Delta C}{2C} = \frac{C_{\max} - C_{\min}}{C_{\max} + C_{\min}}$$

From these formulae it is seen that the negative resistance $-r$ can be increased by increasing m . In practice, a semiconductor diode can be represented by a variable capacitance C_v and a series resistance R_s . In typical diodes operating up to 50 Mc/s, $C_v = 10-15 \text{ pF}$ and $R_s = 15 - 20 \text{ ohm}$; with the diodes operating up to 500 Mc/s, the capacitances are $C_v = 3-6$ or $1-2 \text{ pF}$ and $R_s \approx 10 \text{ ohm}$. It is also possible to employ the capacitance of the collector-base junction in transistors as the reactive element in parametric amplifiers since its capacitance is voltage-dependent. Although a parametric amplifier based on a diode has no shot noise due to electron current, it is not entirely noiseless due to the fact that it contains an ohmic resistance R_s .

E192/E382

Parametric Amplifiers

From the available technical literature, it is known that the effective noise figure for a receiver provided with a semiconductor parametric amplifier is of the order of 0.3 to 1 (from -5 to 0 db). Thus, for a bandwidth of 100 kc/s and an input resistance of 75 ohm it is possible to receive signals whose magnitude is about 0.2 to 0.3 μ V. However, the reduction in the noise of the input stage can result in the increase of the overall sensitivity of a receiver only in that case when the input stage has a sufficiently high gain. In practice, this gain should be of the order of 15 - 20 db and this can easily be realised. There are 6 figures and 1 table.

TITLE: Parametric Amplifiers. Principal Types of a
Parametric Amplifier (PA) Based on Semiconductor
Diodes

PERIODICAL: Radio, 1961, No. 5, pp. 17 - 20 and 25

TEXT: Parametric amplifiers based on semiconductor diodes can be divided into three basic groups: single-circuit regenerative PA; double-circuit PA (regenerative, non-regenerative amplifier-converters and regenerative amplifier-converters) and non-regenerative travelling-wave amplifiers. The operation of these devices and their characteristics are discussed in some detail. The basic circuit of a single tuned amplifier (taken from available literature) is given in Fig. 1a. The regenerative amplification in this circuit is achieved by varying the capacitance C_v periodically at the pump-frequency f_H , which is twice as high as the signal

Card 1/6

Parametric Amplifiers

26055
S/107/61/000/005/001/004
E192/E382

frequency f_c . The circuit shown operates at $f_c = 30$ Mc/s, the input signal being applied to the terminals 1 - 3. The output signal is taken from the terminals 2 - 3 and the pump signal is injected into the terminals 4 - 5. The coil L_1 of the amplifier contains 12 turns wound on a former of 16 mm diameter. The nonlinear capacitor C_v can be in the form of a semiconductor diode or varicap ($C_o = 15 - 40$ pF); alternatively, the collector-base junction of a transistor such as N-403 (P-403) can be used for this purpose; this is shown in Fig. 15. The negative bias voltage of -5 V is applied to the nonlinear capacitor by means of the resistor R_1 from the potentiometer R_2 . The pump signal is fed through the capacitor C_2 and the choke from the coil L_2 , which is wound together with L_3 on the same ferrite core. When operating under regenerative conditions, the amplifier of

Card 2/6

Parametric Amplifiers

26055
S/107/61/000/065/001/004
E192/E382

Fig. 1a can give a stable gain up to 30 db. Alternatively, the system can be operated as a super-regenerator, in which case the pump source is modulated by an auxiliary signal. In this case, the amplification can reach 50 db. Two-circuit parametric amplifiers consist of two tuned circuits coupled by means of the nonlinear capacitance, which changes at frequency f_H under the influence of the pump signal. One of the circuits is tuned to the signal frequency f_c , while the second (auxiliary) circuit is tuned to the difference ($f_H - f_c$) or sum ($f_H + f_c$) frequency. These frequencies are produced as a result of the interaction of the pump and signal voltages at the nonlinear element in the same manner as in the ordinary frequency changer. There are three types of double-circuit parametric amplifiers; these are shown in Figs. 3. One of the main advantages of the double-tuned PA is the possibility of using the pump frequency which is not exactly twice the signal frequency. Secondly, the deviations of the pump frequency and the deviations between the signal

Card 3/6

Parametric Amplifiers

26055
S/107/61/000/005/001/004
E192/E382

and pump phases do not affect the operation of the amplifier. The first circuit of Fig. 3 is a regenerative PA. The signal to the nonlinear capacitor C_v is applied from the tuned circuit $L_1 C_1$, the pump voltage being applied directly to the capacitor. The difference frequency signal is produced in the second tuned circuit $L_2 C_2$. A practical amplifier circuit, operating at 144 Mc/s is described; this is taken from the American journal "QST" of August, 1959. The second circuit of Fig. 3 is a nonregenerative amplifier-converter, which is essentially similar to the first amplifier, except that its auxiliary circuit is tuned to the frequency $f = f_H + f_c$. The last circuit of Fig. 3 is a regenerative parametric amplifier-converter and it differs from the non-regenerative amplifier in that its auxiliary circuit is tuned to the difference frequency. However, this amplifier is based on two effects: the regenerative effect due to the fact that the auxiliary circuit is tuned to the difference frequency and

Card 4/6

Parametric Amplifiers

26055
S/107/61/000/005/001/004
E192/E582

the non-regenerative amplification effect produced as a result of frequency-changing in the nonlinear reactance element since the load is connected to the auxiliary tuned circuit. The travelling wave PA are usually in the form of a section of a long line with a number of parametric diodes; a system of this type is shown in Fig. 9. It is pointed out that the special measures adopted in some PA to reduce noise are not considered and that it is possible to construct PA on the basis of ferromagnetic or cathode-ray elements. It is also mentioned that the parametric amplification effect was discovered by the school of the Soviet scientists L.A. Mandel'shtam and N.D. Papaleksi, who investigated this phenomenon between 1920 and 1940. A large contribution to the investigation of PA is due to the following Soviet scientists: Rytov, Tychinskiy, Etkin, Skvortsova, Gertsenshteyn and others, whose work was published in the journals: Radiotekhnika, Radiotekhnika i elektronika and Radioelektronika. There are 9 figures.

TOPIC TAGS: mixer, uhf mixer, mixer tube, cryogenic circuit, semiconductor diode, semiconductor research	25	
ABSTRACT: The possibility of designing <u>low-noise uhf mixers</u> utilizing the low-temperature properties of semiconductors is discussed. A theoretical analysis was made of the relationship between the basic parameters of cooled mixers and the voltage-current characteristics of diodes. The effect of low temperatures on both the parameters of mixer diodes and the mixers themselves was investigated experimentally on a stand capable of maintaining diode temperatures from room temperature (300K) to the temperature of liquid nitrogen (77K). On the basis of the results obtained, the following conclusions are made: 1) Cooled mixers based on semiconductor diodes can be used as massive stages in supersensitive receiving systems with quantum mechanical and cooled parametric amplifiers at the input. 2) The cooling of mixers utilizing 1400V and 1405V diodes reduces the noise factor to 0.6-3 db. 3) In

of 92-kev gamma radiation from Zn⁶⁷

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki,
v. 42, no. 4, 1962, 1029 - 1035

TEXT: The Mössbauer effect in Zn⁶⁷ has been studied by the Doppler shift
and frequency modulation methods. The energy spectrum of 92-kev gamma rays
was recorded at ~4.2°K using a source and a filter (up to 33% Zn⁶⁷), both
made of ZnO. The statistical error in the measurements was 2·10⁻⁴. Resonan-
ce absorption, observed at zero energy shift, reached a maximum of 2·10⁻³.
The line width was somewhat greater than the natural width. The structure
of the resonance-absorption energy spectrum shows quadrupole splitting of the

Card 1/10 2

Energy spectrum of ...

ABSTRACT: To increase the number of Mossbauer γ transitions suitable for research, the authors investigated the 22.5-keV γ transition of Sm¹⁴⁹ in the form of Sm₂O₃ with approximate activity 5×10^4 quanta/sec.. The apparatus is described, together with the steps ta-

Card 1/72

ACCESSION NR: AP4019209

ken to eliminate the effect of the neighboring 41-keV gamma radiation of samarium. A line width of $(1.35 \pm 0.1) \times 10^{-7}$ was obtained at room temperature, corresponding to a broadening by a factor of 2.3.

A cross section of $(8.4 \pm 2.5) \times 10^4$ barns was obtained. The most likely spin of the 22.5-keV level is 5/2. It is claimed that the availability of more active sources and further development of the experimental technique will make the Mossbauei effect on Sm¹⁴⁹ a useful research tool. "In conclusion the authors are grateful to P. Shapiro for continuous interest in the work, Zh. Zhelev for useful discussions, V. Grigalisa, Z. Marish, Ye. Pikel'ner, S. Salakhidinov, and A. Saltirin for help with the measurements, and A. Novgorodov for help in preparing the source." Orig. art. has: 5 figures and 5 formulas.
